ROTEX

One API. Every GPU. Zero cost.

A modular Rust graphics engine built on one zero-cost rendering API.

Vulkan | D3D12 | OpenGL | WebGL | wgpu | Metal · planned

BRAND GUIDELINES · V1.0 · NOVEMBER 2026

Identity system for Rotex Engine and the rotex-labs GitHub organisation: logo, colour, type, patterns, components, voice.

One API. Every GPU. Zero cost.

Rotex Engine is a modular Rust graphics engine. Its core is a single rendering API, the RHI, that compiles straight to native Vulkan, Direct3D 12, OpenGL / WebGL and wgpu calls. Dispatch is static (`Device<B>`), so there is no vtable and no hidden cost.

Features ship as **vertical slices**. **Core slices** behave the same on every backend. **Extension slices** such as ray tracing, mesh shaders and bindless are opt-in at compile time through `Supports<Feature>`. Every feature reports whether it is **Native**, **Emulated** or **Absent**.

For engine and tools programmers who want native performance on every platform without writing four renderers.

Proof points

- Static dispatch, typed `CommandEncoder`
- Explicit capability table per backend
- One shader source cooked to SPIR-V, HLSL/DXIL, MSL, GLSL and WGSL
- Render graph with automatic barriers
- Small crates, one workspace, scoped releases

Vulkan	active	D3D12	in progress	wgpu	active
OpenGL	planned	WebGL	planned	Metal	planned

Rotex, rotex-core, rotex-labs

USE	AVOID
Rotex in running text. **Rotex Engine** on first mention	ROTEX in body text (all caps is for the wordmark only), RoTex, Rotex™
`rotex-core`, `rotex-vulkan`: lowercase code style	Rotex-Core, RotexCore
GitHub org **rotex-labs**	rotexengine (old name, still in some `Cargo.toml` URLs)
the Rotex RHI / the Rotex API	"RTX" (NVIDIA trademark)

Backend names: **Vulkan**, **Direct3D 12** / **D3D12**, **OpenGL**, **OpenGL ES**, **WebGL2**, **wgpu** (always lowercase), **WebGPU**, **Metal**. These are trademarks of Khronos, Microsoft, Apple and the gfx-rs project. Write them as plain text and never use their logos in Rotex art.

The Rotor Cube

hex R · hub 0.24R · twist 22° · gap 0.065R · corner 0.08R

An isometric hexagon split into three faces, each twisted 22° around a triangular hub. The **cube** stands for 3D rendering and the GPU. The **twist** is the rotor and the name, evolved from the original three-blade mark. The **hub** is the one API that every slice passes through.

The three solid tones (lit / mid / shade) replace the old opacity falloff of 1 / .8 / .68. On dark they are Amber 300 / 500 / 700. On light they are 500 / 600 / 800.

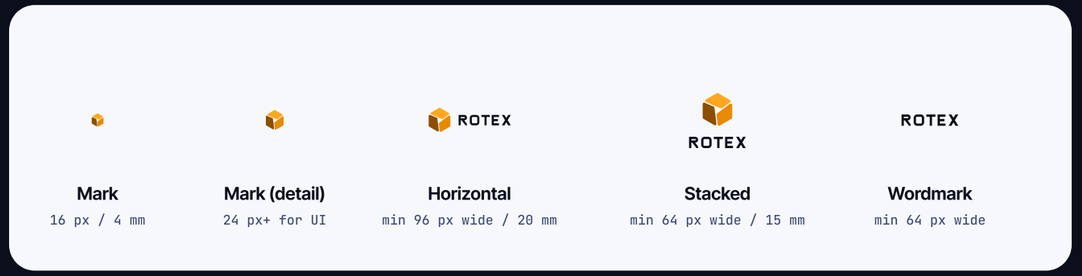

Files in `logo/`: mark, horizontal (primary), stacked and wordmark, each in color-on-dark, color-on-light, mono-black and mono-white.

Give it room

x = cap height of ROTEX = 0.4 × mark height

Keep at least **x** clear on every side, where x is the cap height of ROTEX (0.4 × mark height). For the mark alone, keep 0.25 × mark height clear. The lockup SVGs already include this padding.

At 32 px and below, use `icons/favicon.svg` and the favicon PNGs. This cut has wider gaps and smaller corners so it stays crisp.

The wordmark is custom-drawn and outlined. Never retype it in a font.

Logo misuse

DO Use color on graphite

DO Use color on paper

DO Use mono on photos

DON'T Stretch or squash

DON'T Rotate the lockup

DON'T Recolor to rust

DON'T Add effects

DON'T Low contrast

DON'T Retype the wordmark

DON'T Rearrange elements

Rotor Amber on Graphite Blue

Graphite 950 #0B0F1C RGB 11 15 28	**Graphite 900** #10162A RGB 16 22 42	**Graphite 800** #1A2238 RGB 26 34 56	**Graphite 700** #283252 RGB 40 50 82	**Graphite 400** #7C88A8 RGB 124 136 168	**Graphite 300** #A9B3CC RGB 169 179 204	**Paper 50** #F6F8FC RGB 246 248 252	**Amber 300** #FFD06B RGB 255 208 107
Rotor Amber 500 #FFA81F RGB 255 168 31	**Amber 600** #E88A00 RGB 232 138 0	**Amber 700** #B86A00 RGB 184 106 0	**Amber 800** #8C4F00 RGB 140 79 0	**Signal Cyan 400** #3FD0F2 RGB 63 208 242	**Cyan 700** #0B7593 RGB 11 117 147	**Native 400** #34D399 RGB 52 211 153	

Ratio: about 70% Graphite, 20% Paper, 8% Amber and 2% Cyan. The hue is about 36° (gold-amber) on a cool blue-black ground. That separates it clearly from Sidermux's rust #E25E28 (about 17°) on neutral iron #0E1013. Signal Cyan is for links, data flow and the API spine in diagrams.

07 · CONTRAST (WCAG 2.2)

Measured text pairs

Paper text on Graphite 950	#F6F8FC / #0B0F1C	**17.97:1**	AAA
Muted text on Graphite 950	#A9B3CC / #0B0F1C	**9.10:1**	AAA
Subtle text on Graphite 950	#7C88A8 / #0B0F1C	**5.41:1**	AA
Rotor Amber on Graphite 950	#FFA81F / #0B0F1C	**9.89:1**	AAA
Amber 300 on Graphite 950	#FFD06B / #0B0F1C	**13.18:1**	AAA
Signal Cyan on Graphite 950	#3FD0F2 / #0B0F1C	**10.48:1**	AAA
Native green on Graphite 950	#34D399 / #0B0F1C	**9.94:1**	AAA
Graphite 950 on Rotor Amber (buttons)	#0B0F1C / #FFA81F	**9.89:1**	AAA
Graphite text on Paper 50	#0B0F1C / #F6F8FC	**17.97:1**	AAA
Muted text on Paper 50	#3D4870 / #F6F8FC	**8.37:1**	AAA
Subtle text on White	#5B6688 / #FFFFFF	**5.67:1**	AA
Amber 700 on White	#B86A00 / #FFFFFF	**4.12:1**	AA Large / UI
Amber 800 on White	#8C4F00 / #FFFFFF	**6.49:1**	AA
Cyan 700 on White	#0B7593 / #FFFFFF	**5.28:1**	AA
Native 700 on White	#0E7A55 / #FFFFFF	**5.34:1**	AA
Rotor Amber on White (graphics only)	#FFA81F / #FFFFFF	**1.93:1**	Fail (decor only)

Amber text on light backgrounds must use **Amber 800**. Rotor Amber on white is for graphics and button fills only, with Graphite text on top.

Inter, Inter Tight, JetBrains Mono

DISPLAY · INTER TIGHT 750

Zero cost.

Headlines, slides and banners. Tracking −1 to −2%.

TEXT · INTER 400/500/600

Core slices behave the same on every backend. Extension slices are opt-in at compile time.

16 px base, 1.6 line height.

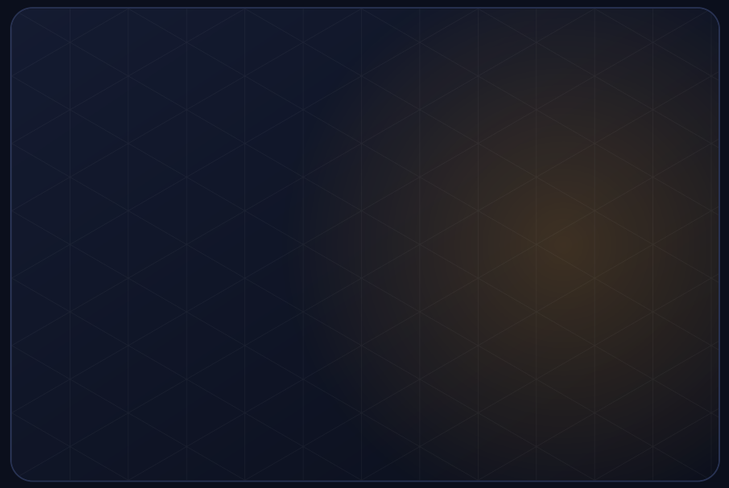

CODE · JETBRAINS MONO

```
fn render<B: Backend + Supports<RayTracing>>()
```

Crate names, types and labels. Uppercase labels are tracked +12%.

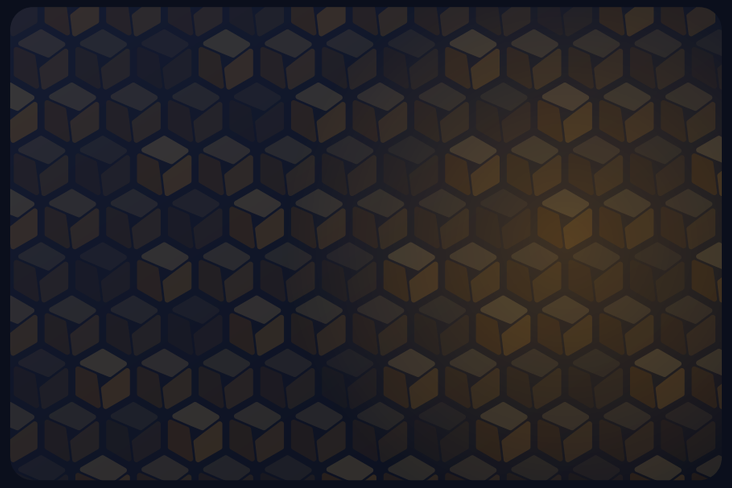

Scale 1.25: 12 · 14 · 16 · 20 · 25 · 31 · 39 · 49 · 61 px. All three typefaces are under the SIL Open Font License 1.1. The files and licences are in `fonts/`, and the tokens are in `docs/rotex-tokens.css`.

Lattice, ghost, glow

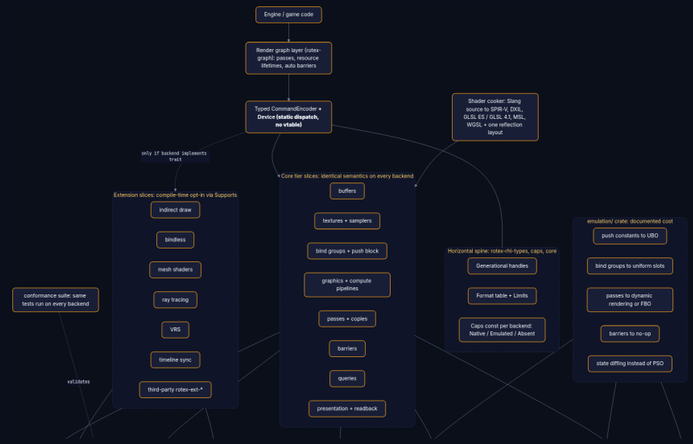

Isometric lattice

Lines at +30°, −30° and vertical, the geometry of the mark. Use at 3–7% opacity.

Cube field

Tiled marks at varying opacity. For covers, stickers and end cards.

Diagrams

Use the Mermaid brand theme. Amber is the API, cyan is data and shader flow, and green, amber and grey are Native, Emulated and Absent.

Use one oversized ghost mark (7–10% opacity) and one soft amber glow per layout. Avoid GPU stock photos, lens flares, neon cyberpunk looks and vendor logos.

Capability tags = `rotex_types::Support`

NATIVE
EMULATED
— ABSENT

Shape carries the meaning (solid dot, half dot, dash) as well as colour, so the tags work for colour-blind readers.

Precise, honest, calm

- **Say what is native and what is emulated.** The capability model is the brand.
- **Show code before claims.** One snippet beats three adjectives.
- **Use short sentences and active verbs.** No "blazing", "revolutionary" or "next-gen".
- **Be warm with contributors.** Credit them by name and explain the reason behind every "no".

INSTEAD OF	WRITE
Blazing-fast next-gen renderer for every platform!!	One API over Vulkan, D3D12, GL and wgpu. Static dispatch, no vtable.
Ray tracing support	Ray tracing: native on Vulkan and D3D12, absent on GL/WebGL.

Three options, one pick

RECOMMENDED

One API. Every GPU. Zero cost.

The whole value proposition in six words, with the three claims in priority order. Use it on banners, social and the README.

TALKS / WEBSITE

Write it once. Render it natively.

Friendlier and benefit-led. Good for hero sections and conference slides.

CRATES.IO / GITHUB DESCRIPTION

The zero-cost graphics spine for Rust.

Precise and searchable. Speaks to the architecture.

The kit in use

ROTEX
